LangGraph

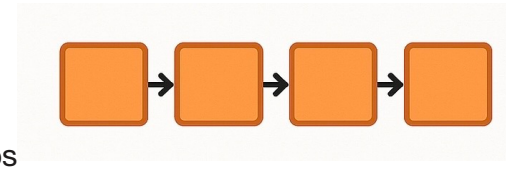

- LangGraph = **framework** to build **AI agents** as workflows (**graphs**)
- You define flow (**nodes** + **edges** + **state**)
- Supports built-in **branching**, **loops**, **retries**
- Centralized state management
- More deterministic and production-ready
- **Easier** to **scale** and **debug**

— Think: **flowchart for AI agents**

Why LangChain not enough ?

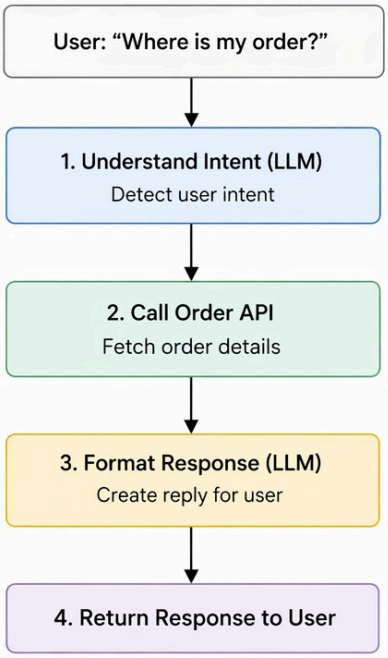

- Supports: **chains** (**linear** steps), prompts, agents
- **Flow** often **decided** by **LLM** → can be **unpredictable**
- **Complex logic** handled with **if-else** in your code
- **No** clean **support** for **loops**, **retries**, **branching**
- Weak state management → **harder** to **scale** & **debug**

— **LangChain** → **LLM** decides what to do **next**
— **LangGraph** → **You decide** the flow, **LLM executes** steps

Using LangChain
